History

Nehemiah Grew (UK, 1684)
Pioneering scientist.

Described the existence of
ridges, valleys, and
sweat pores.

History

Marcello Malpighi
(University of Bologna, Italy, 1686)
Pioneering classification of
fingerprints.

Noticed that there were
similar patterns across fingerprints,
which could be used to group
samples.

History

Sir William Herschel (UK, 1858)

Pioneering usage of fingerprints
for identification.

Noticed the uniqueness and
permanence of fingerprints.

Used fingerprints within contracts
while working as an officer in the
Indian Civil Service.

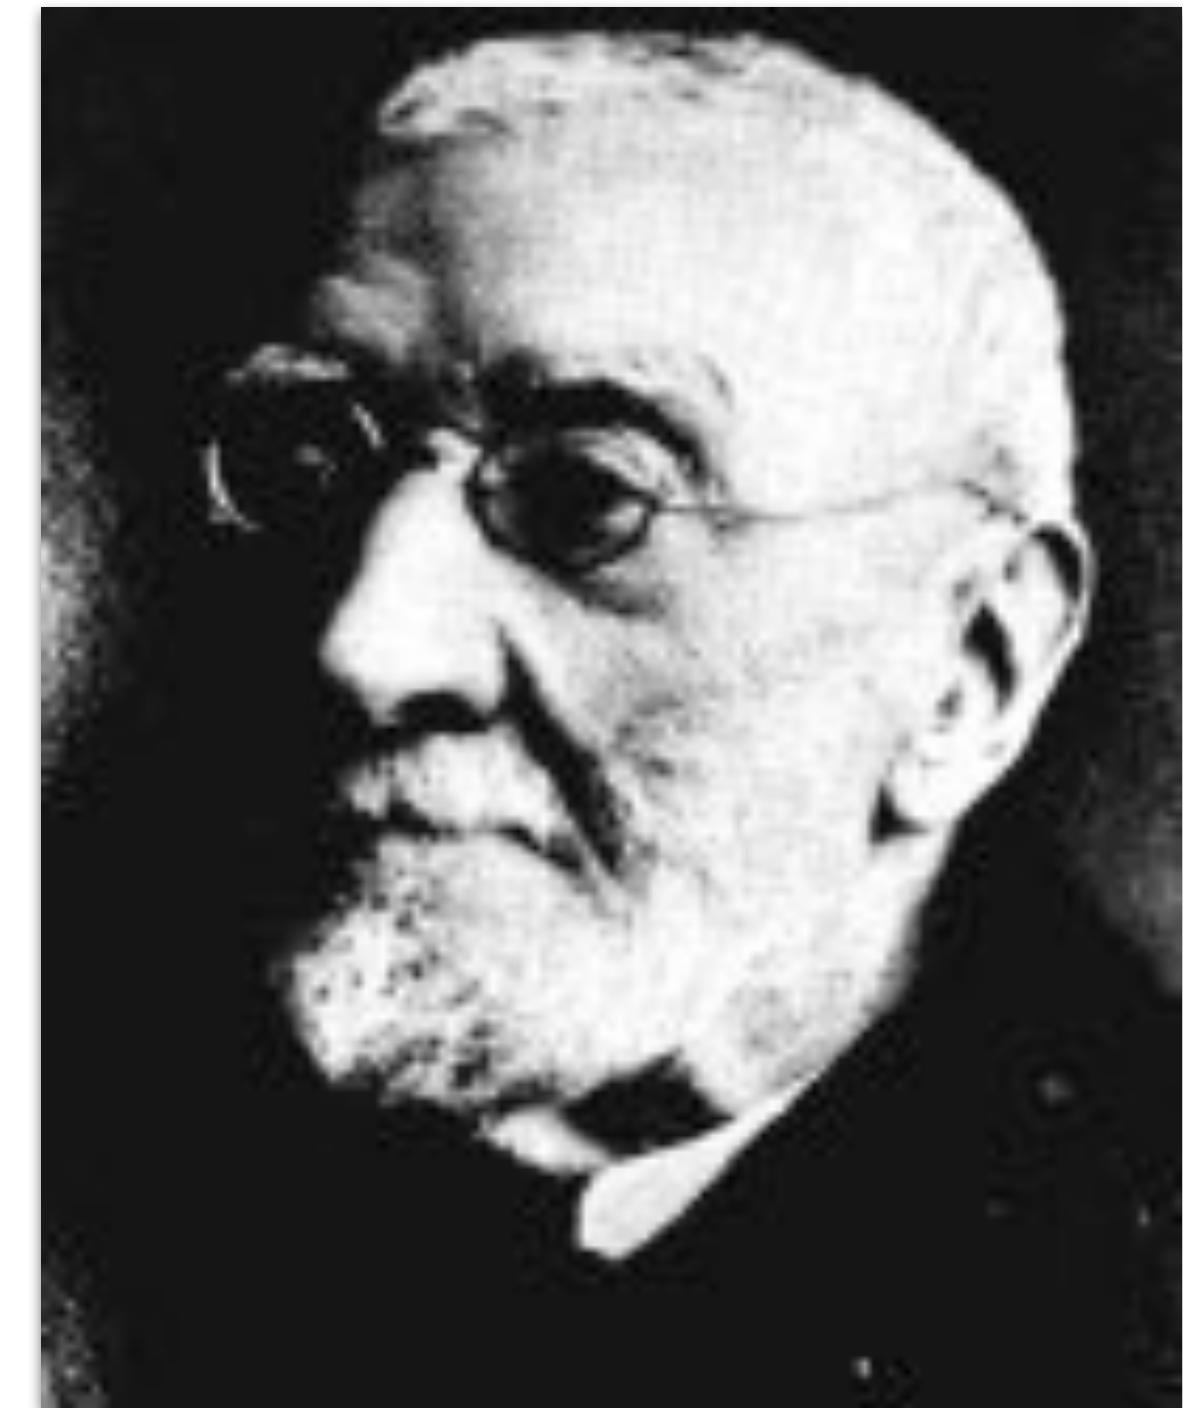

History

Henry Faulds (UK, 1880)

Pioneering usage of fingerprints
in a forensic scenario.

Collected a latent fingerprint from a bottle
and identified the author of a theft
in a hospital in Tokyo.

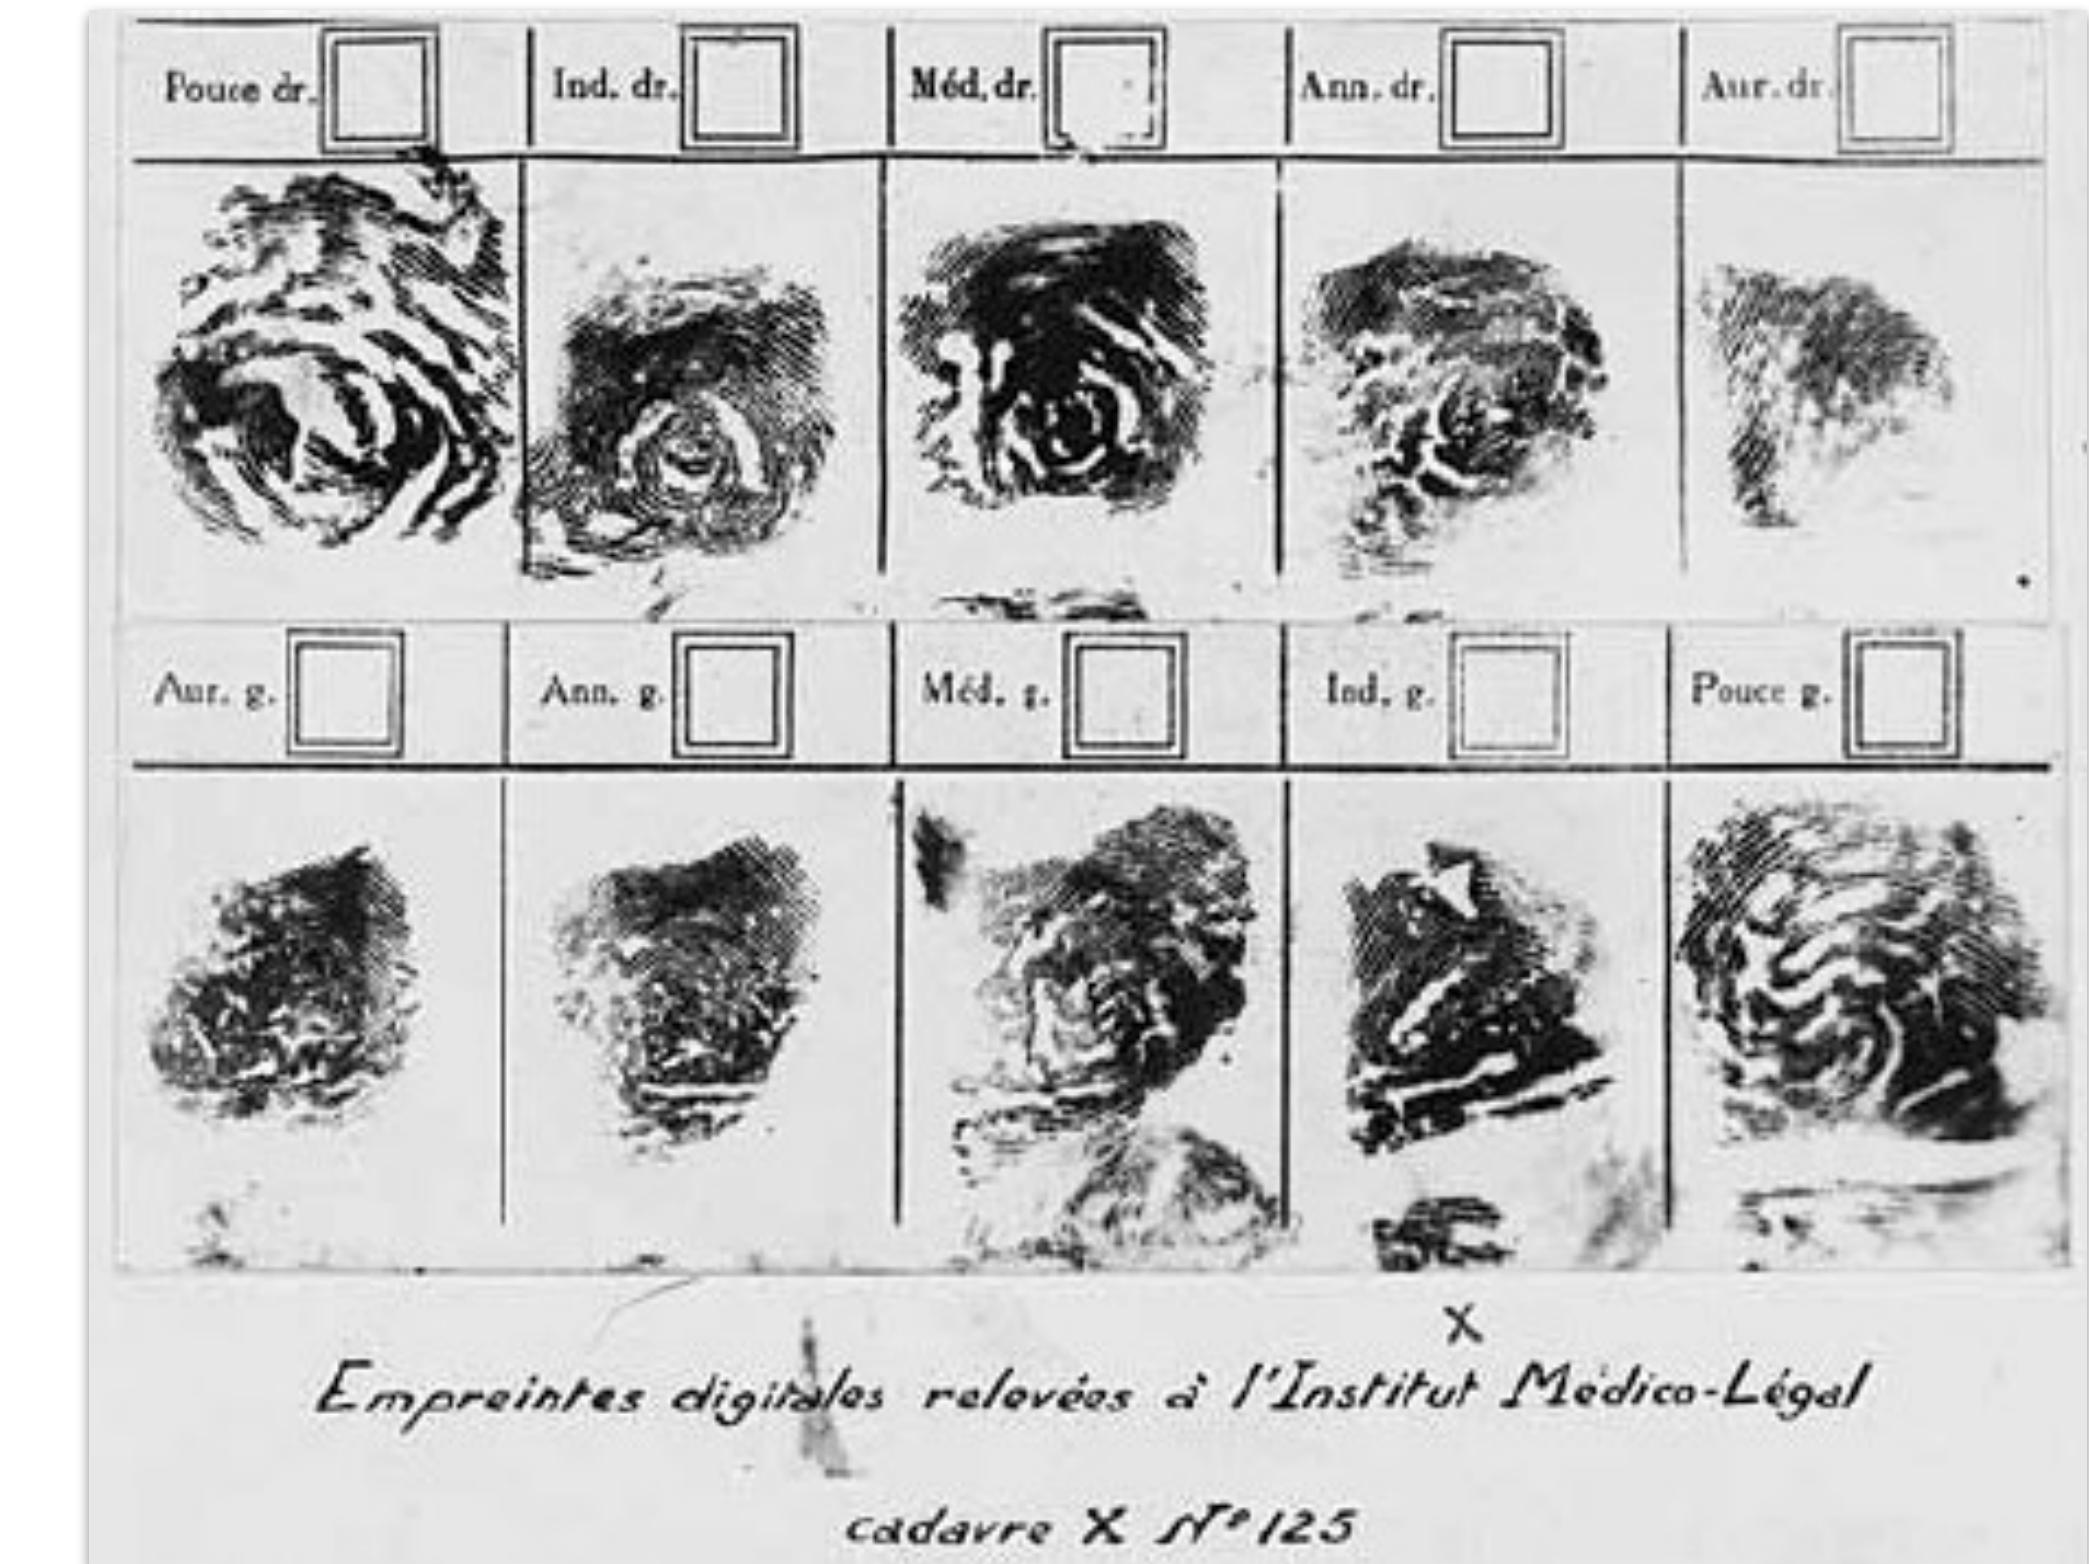

History

Henry Faulds (UK, 1880)

Pioneering usage of fingerprints
in a forensic scenario.

Performed the first experiments
showing the uniqueness of
fingerprints.

History

Sir Francis Galton (UK, 1888)

Pioneering method of feature extraction.

Definition of **singular points** and
minutiae, a.k.a. Galton's details
(more details soon).

History

Galton, F.
Finger Prints
MacMillan and Co., New York, 1892

Sir Francis Galton (UK, 1888)

Pioneering method of feature extraction.

Publication of book “Finger Prints”,
containing fundamental contributions to Biometrics.
Estimate of 2 people presenting the
same fingerprint: **1 in 64 billion**.

Book available at:
<http://galton.org/books/finger-prints/galton-1892-fingerprints-1up.pdf>

History

Sir Francis Galton (UK, 1888)
Pioneer method of feature extraction.

**New York Times book review
(Jan 1893)**

What Mr. Galton wants to show is that through the prints made by the finger tips we have an absolute method of identification. **As to that stupid thing, palmistry, our authority says it has no more significance than the creases on old clothes.**

MR. GALTON ON FINGER PRINTS.

FINGER PRINTS. By Francis Galton, F. R. S.
New-York: Macmillan & Co.

Mr. Galton devotes his life to the elucidation of the queer and the curious. Undoubtedly there is nothing a man masters which is not of some benefit to his fellows, though centuries may elapse before the application comes. In his present volume Mr. Galton gives the results of a number of years of research, devoted to those tiny ridges of skin which appear in the ends of the fingers. They are the so-called "papillary" ridges. Carried away by his enthusiasm, Mr. Galton declares that these markings "are in some respects the most important of all anthropological data." He makes, too, the statement that they "have the unique merit of retaining all their peculiarities unchanged throughout life, and afford in consequence an incomparably surer criterion of identity than any other bodily feature."

The presence of these minute ridges on the finger tips became the subject of physiological study long ago. Strangely enough, they are perfectly defined in monkeys, but appear "in a much less advanced stage in other mammalia." We know that the finger tips are studded with pores. There are an infinite number of mouths always open which lead to ducts that secrete perspiration. The ridges must assist touch, as they "help in the discrimination of the character of surfaces that are variously rubbed as held between the fingers. These ridges are visible in the child unborn: they increase with the growth of the individual, and are sharply defined until old age sets in. Moderate work develops them, and they are visible on the toes. They are faintly developed in the hands of ladies." The ensuing statement used by Mr. Galton is not fortunate, for he adds that "they are not visible on the fingers of idiots of the lowest type, who are incapable of laboring at all."

What Mr. Galton wants to show is that through the prints made by the finger tips we have an absolute method of identification. As to that stupid thing, palmistry, our authority says it has no more significance than the creases on old clothes. The ridges Mr. Galton divides into three categories of arches, loops, and whorls, and his book abounds in curious pictures or finger prints, magnified by means of the camera. It seems to us to be terribly complex. As no two persons' finger tips are considered to be alike, and as there is individualism in the fingers of the right and left hand, and there are ten fingers in all, there would have to be ten distinct examinations before an identification could be positive.

When one comes to the real practical use of the finger-mark method it seems to have none. If there be any reliance to be put in it as a means of identification it would require an expert having uncommon powers of observation. When we are told that there are "about thirty-five points [of resemblance] situated on the bulb of each of the ten digits, in addition to more than 100 on the ball of the thumb," it may be seen how troublesome the matter is likely to be. Then, as one has to work up over a thousand points on his own hands, or on somebody else's hands, hours, days, and weeks might elapse before anything like a conclusion could be reached. Scientifically, when further treated, the subject may be of minor interest; practically, it has none at all. The book, of course, shows that diligence and hard work which are common to everything Mr. Galton does, but, really, "the play is not worth the candle."

History

Juan Vucetich (Argentina, 1892)

Pioneering criminal conviction based
on fingerprints.

Rojas case

Woman accused of murder
based on bloody fingerprint
left at crime scene.

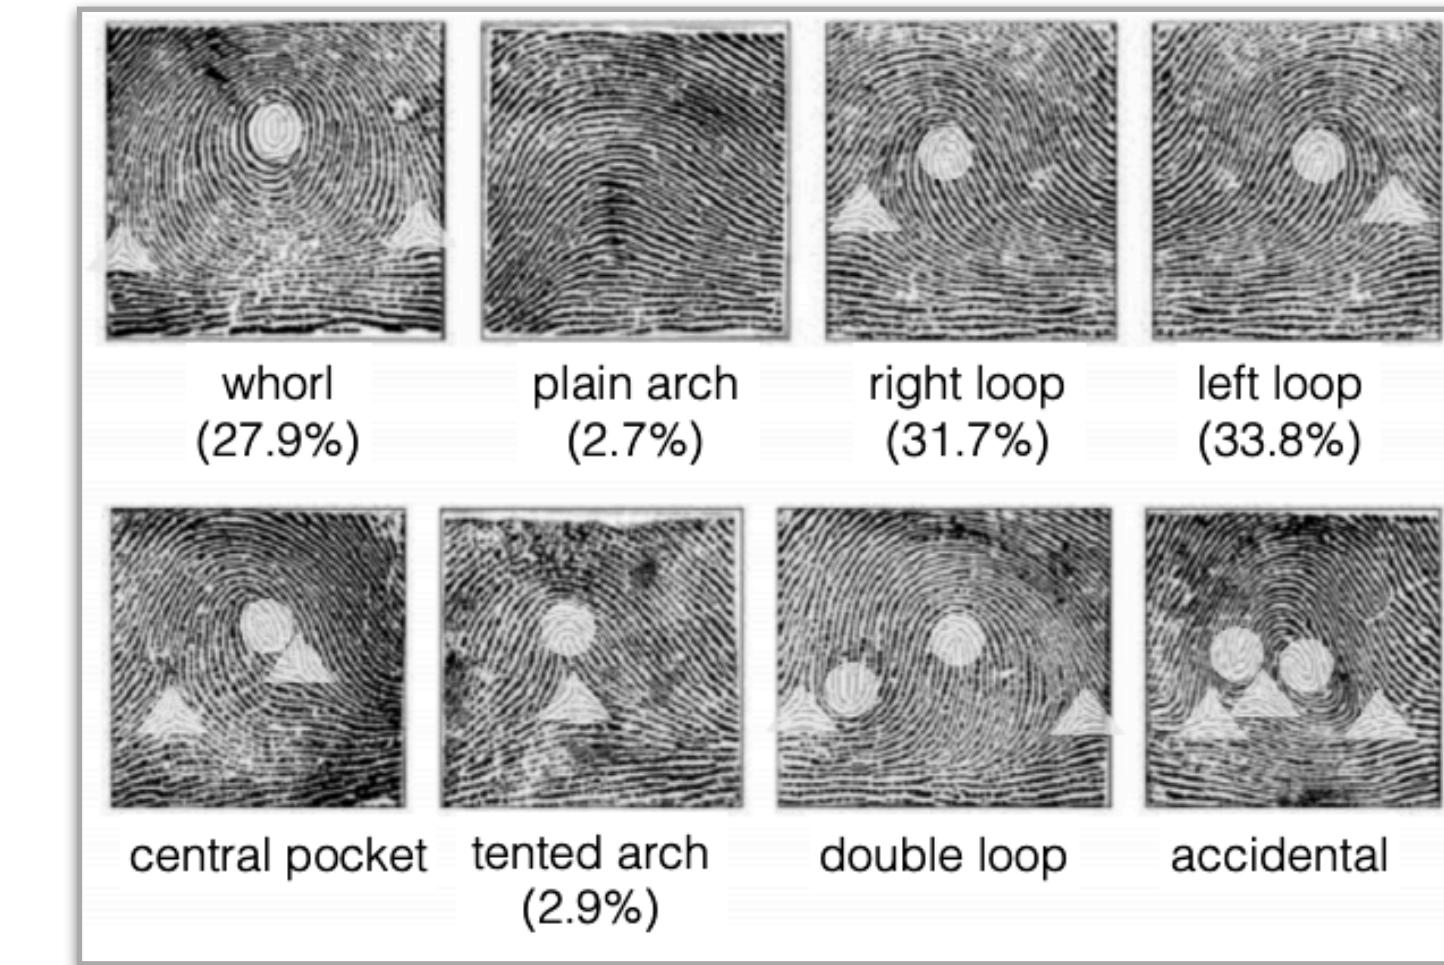

History

Sir Edward Henry (UK, 1897)

Pioneering fingerprint classification and indexing method.

Work at Calcutta, India

Speeded up the process of searching for fingerprints.

Henry's fingerprint classification.

History

Edmond Locard (France, 1910)

Pioneering methodology
to be adopted in court.

A defendant should be pronounced guilty if at least 12 features match in the sample and reference material.

History

XX-Century Acceptance

Scotland Yard, 1903

Fingerprints start to be officially used.

International Association for Identification, 1915

Creation of the largest forensic association in the world.

FBI, 1924

Fingerprint Identification Division is established.

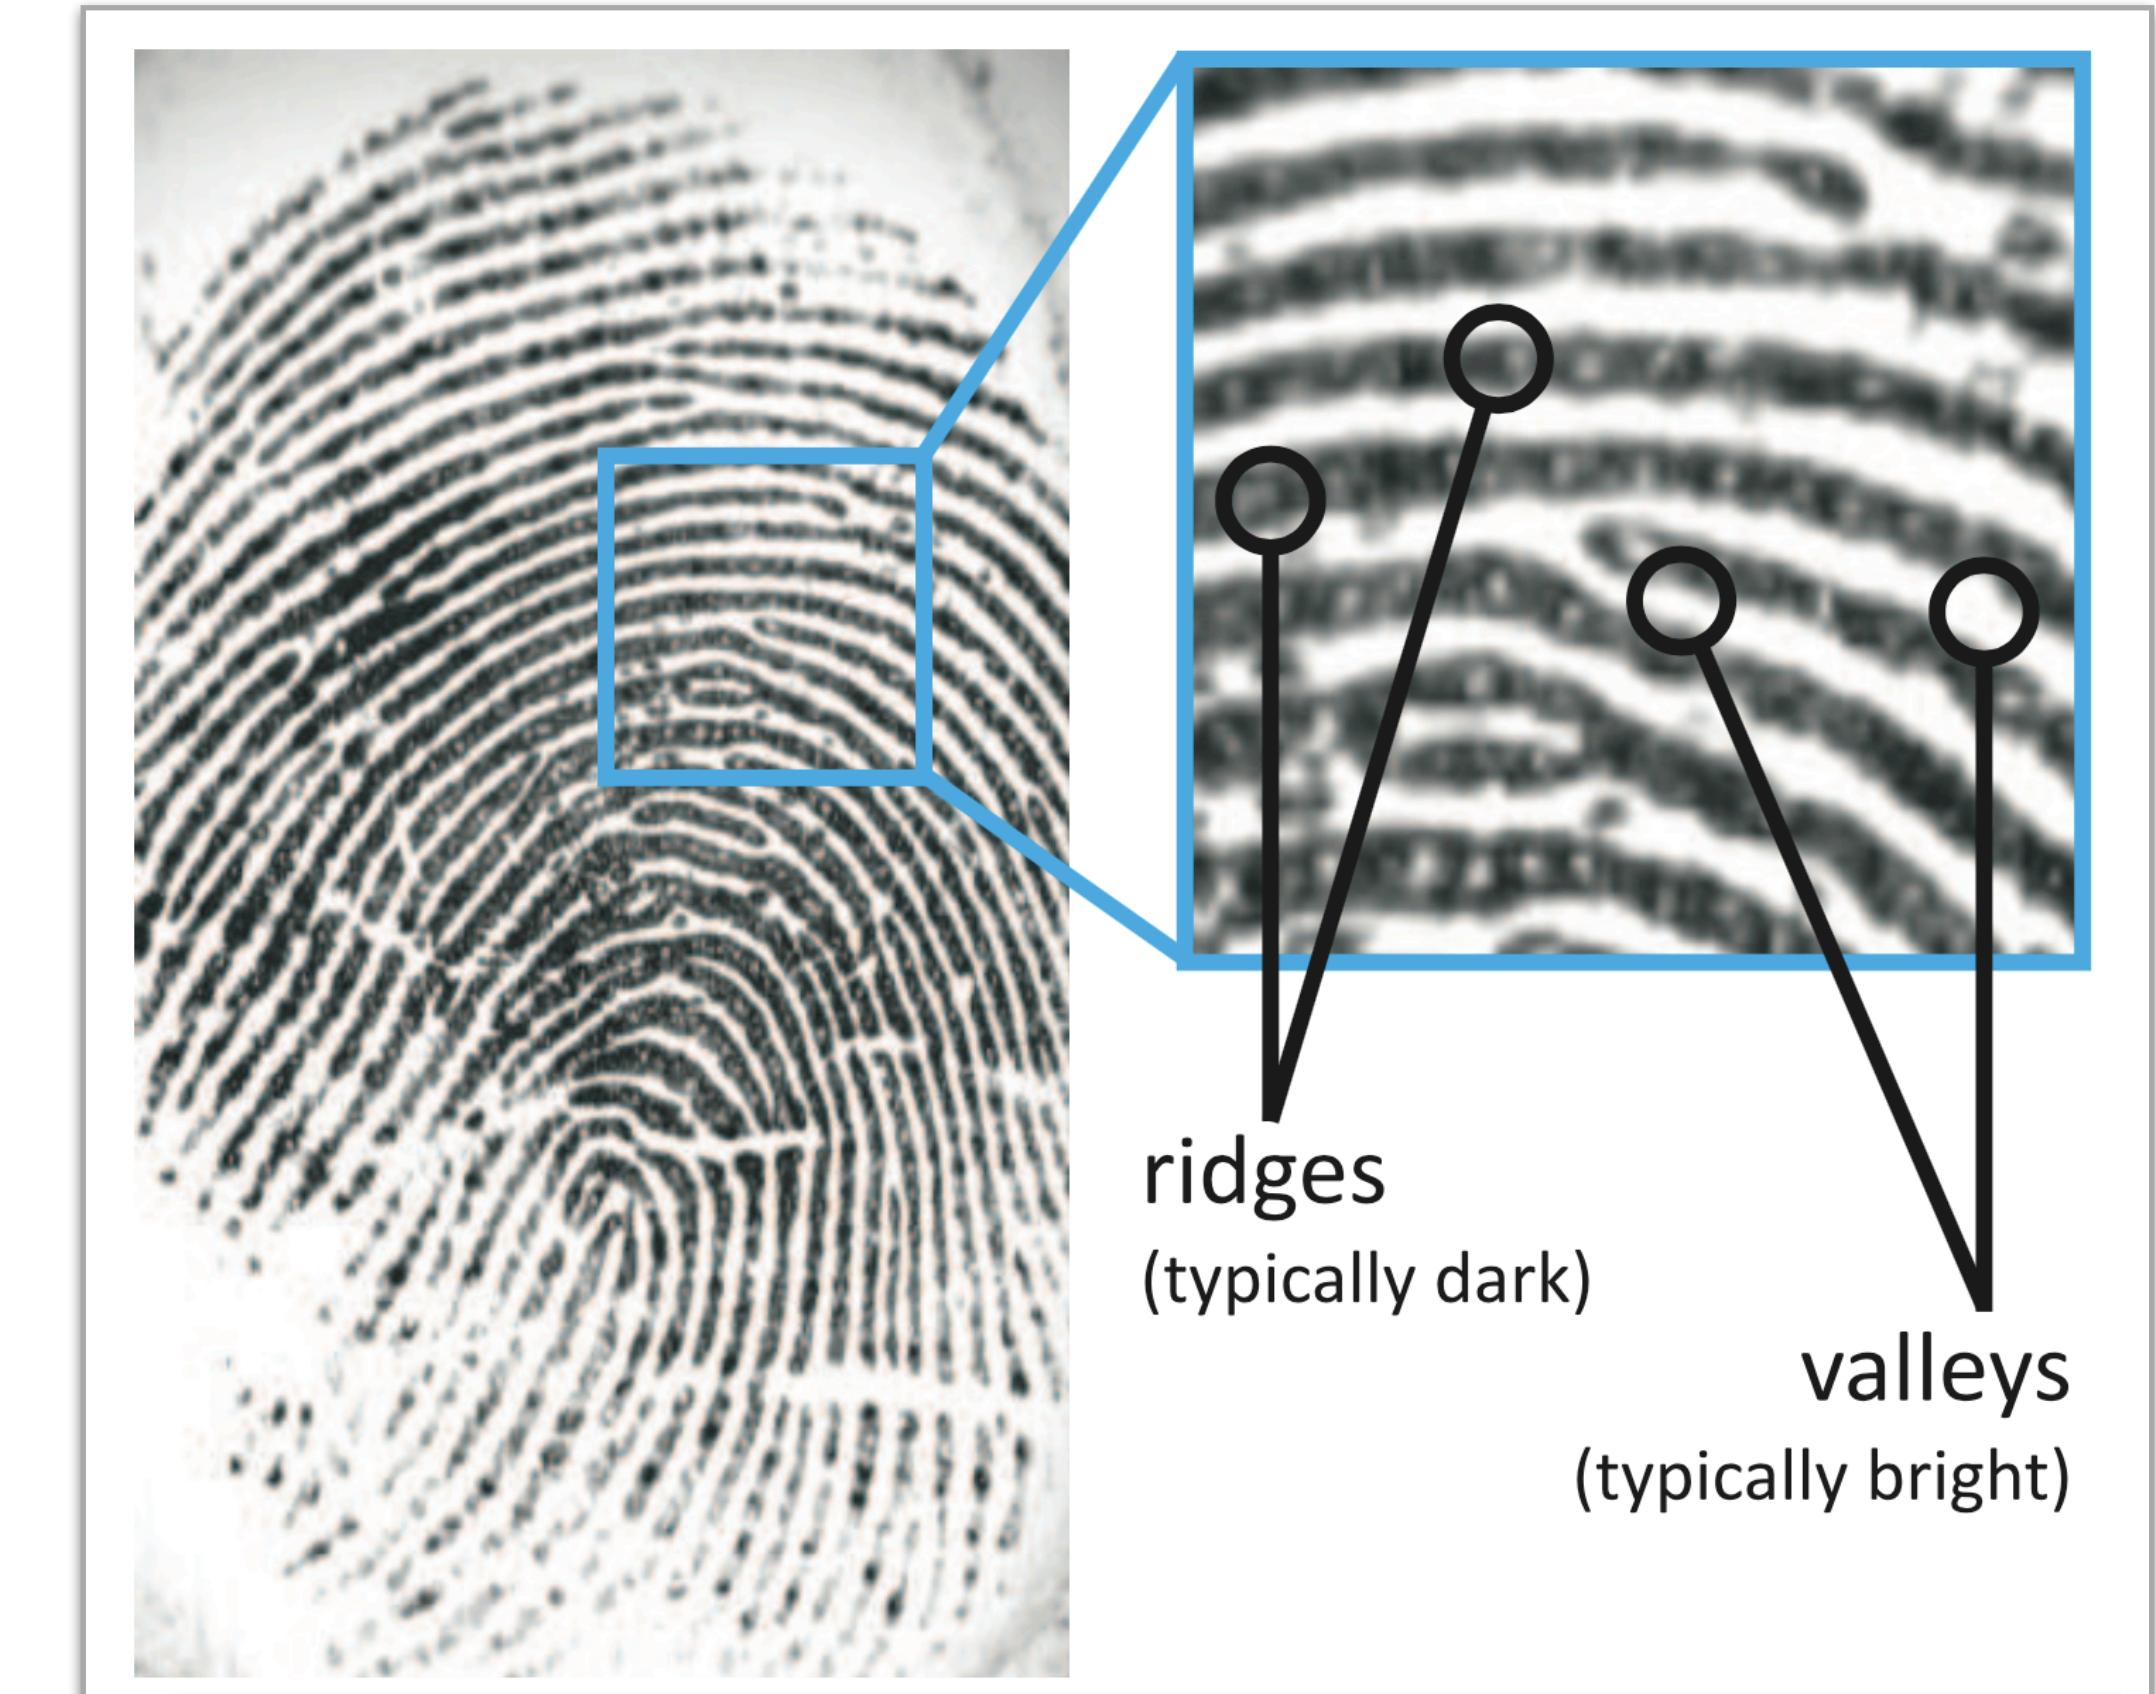

Features

**What do we observe
in fingerprints?**

Ridges and Valleys

Embryology hypothesis:

Ridges appear as a result of the stresses in the womb during the growth of the fetus.

Source: Dr. Adam Czajka

Features

**What do we observe
in fingerprints?**

Beyond Ridges and Valleys

Three types of features,

Level-2 Features

Usage of minutiae
Fingerprint matching.

More details on **how** to do it
in the upcoming classes.

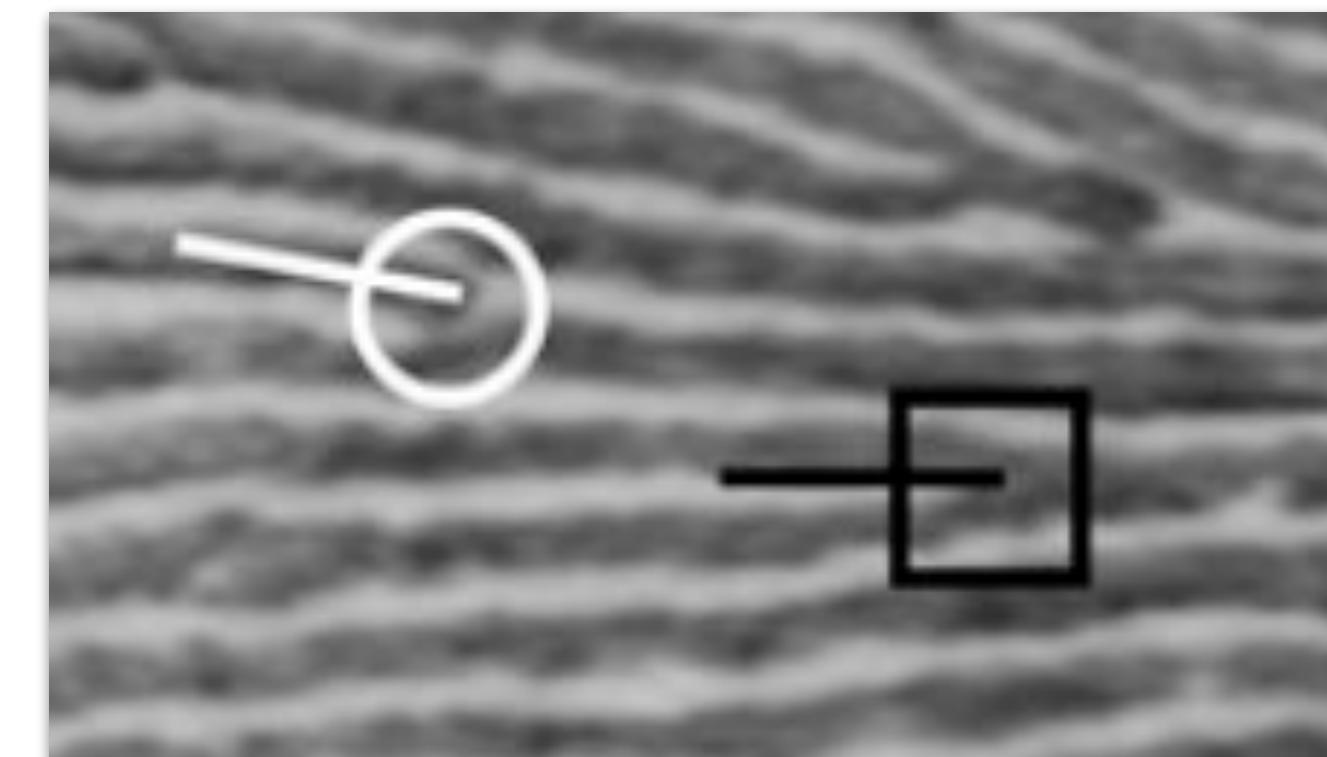

Features

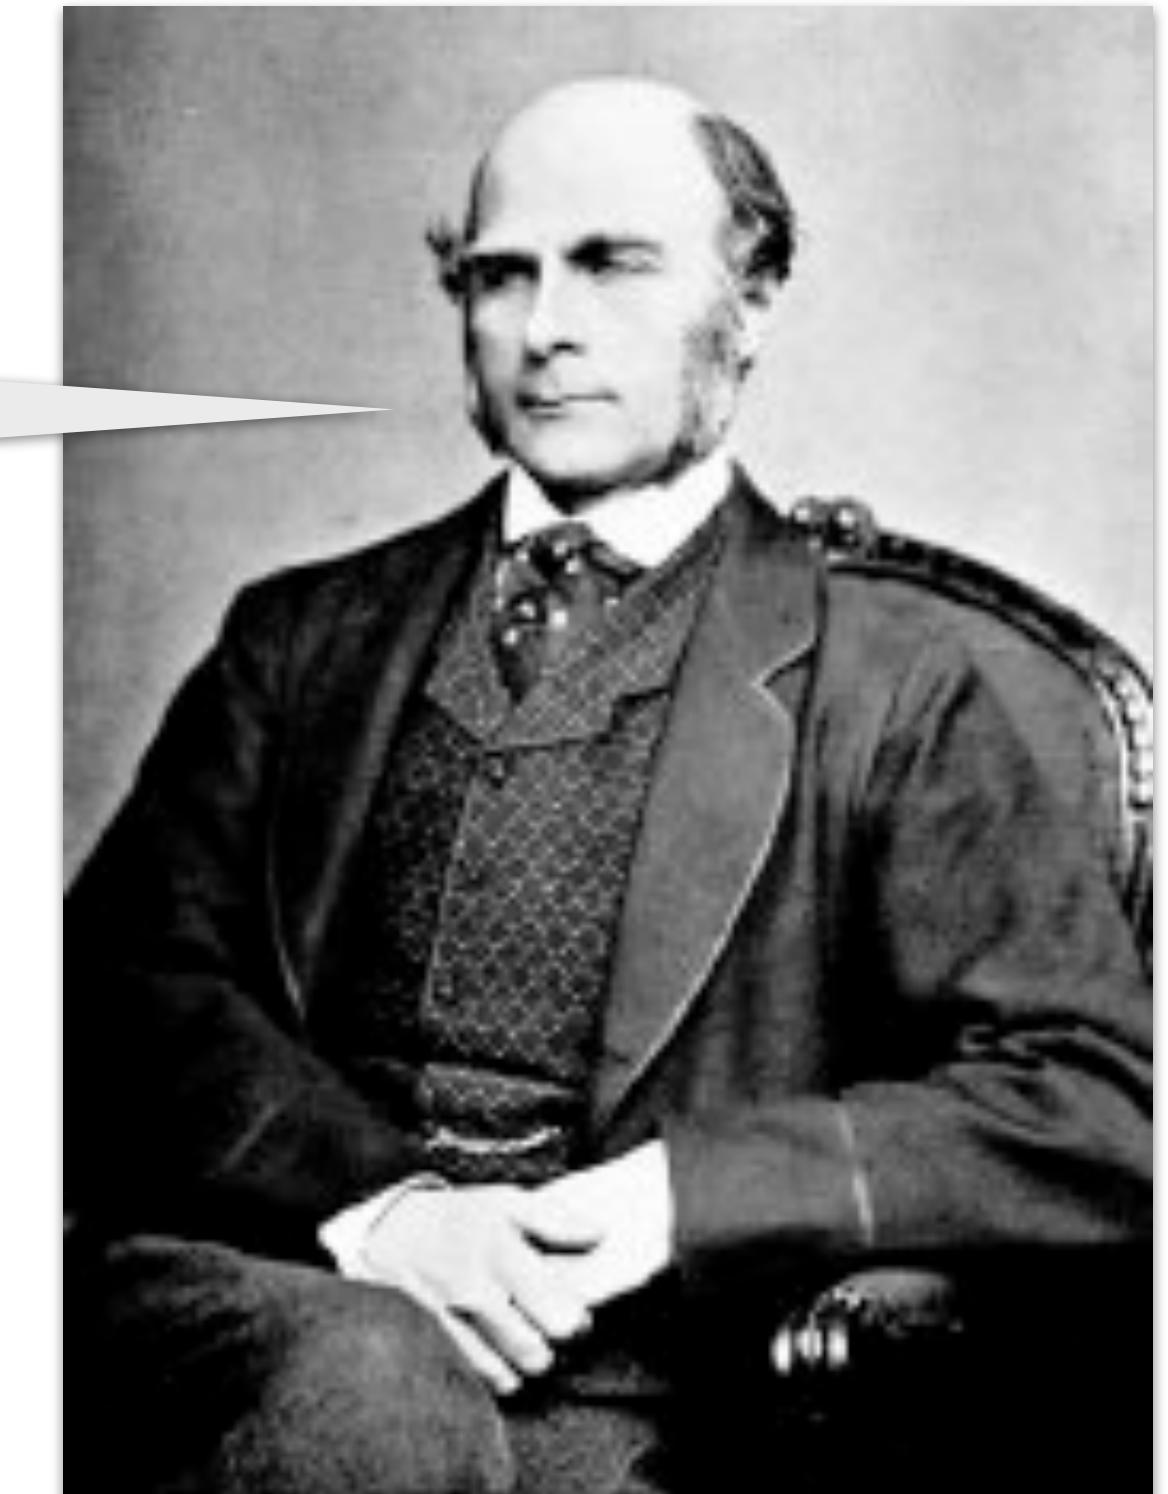

Level-2 Features

Galton's Estimate

Given 2 similar fingerprints,
what is the chance they come
from different people?
I'll tell you: 1 in 64 billion.

Jain, Ross, and Nadakumar
Introduction to Biometrics
Springer Books, 2011

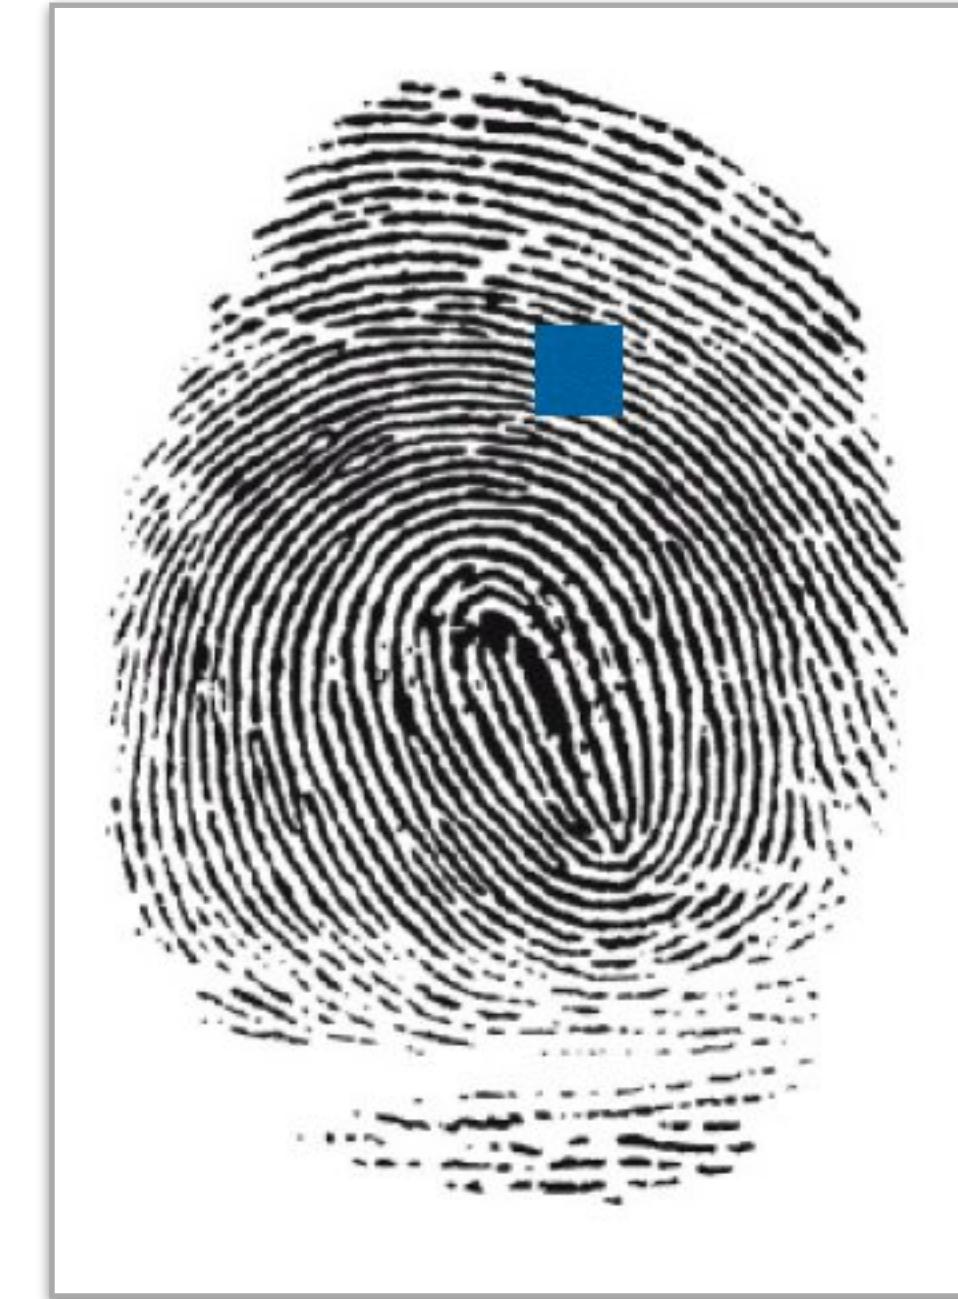

Features

Level-2 Features

Galton's Estimate

Rationale

What would be the smallest portion of a fingerprint leading to a 1/2 chance of being correctly guessed as belonging to a particular individual?

Source:
Dr. Walter Scheirer

Features

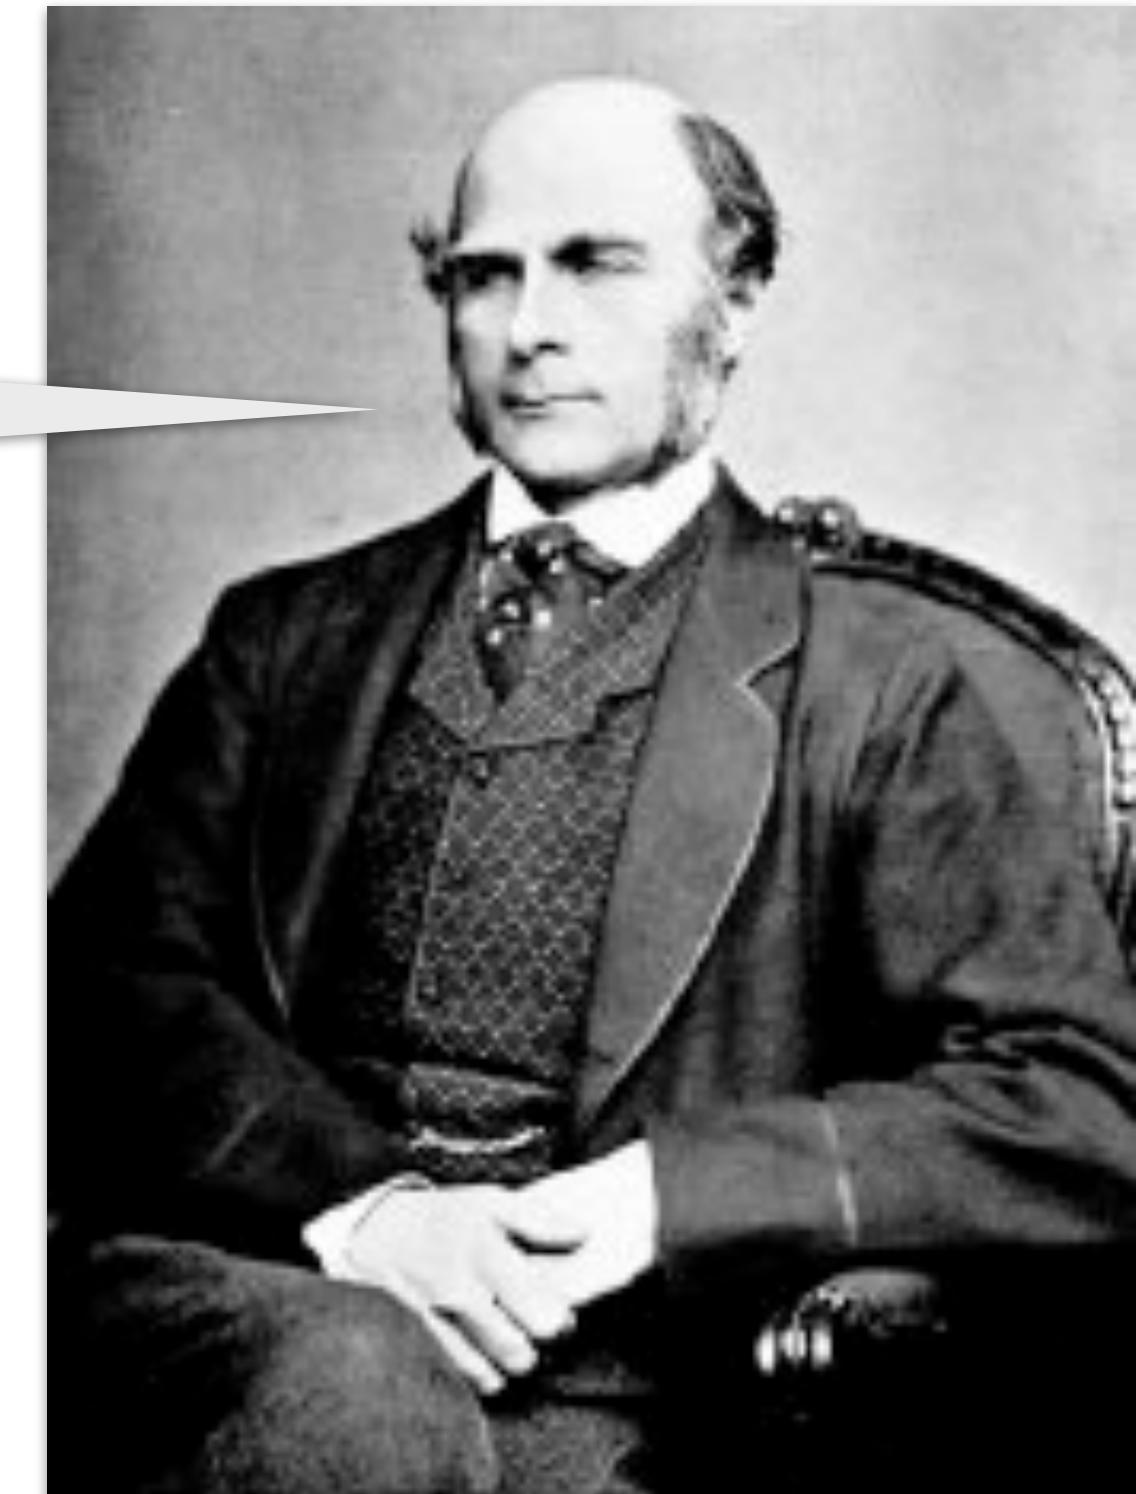

Level-2 Features

Galton's Estimate

Rationale

What would be the smallest portion of a fingerprint leading to a 1/2 chance of being correctly guessed as belonging to a particular individual?

After a few trials, let me say:
A square containing 5-6 ridges.

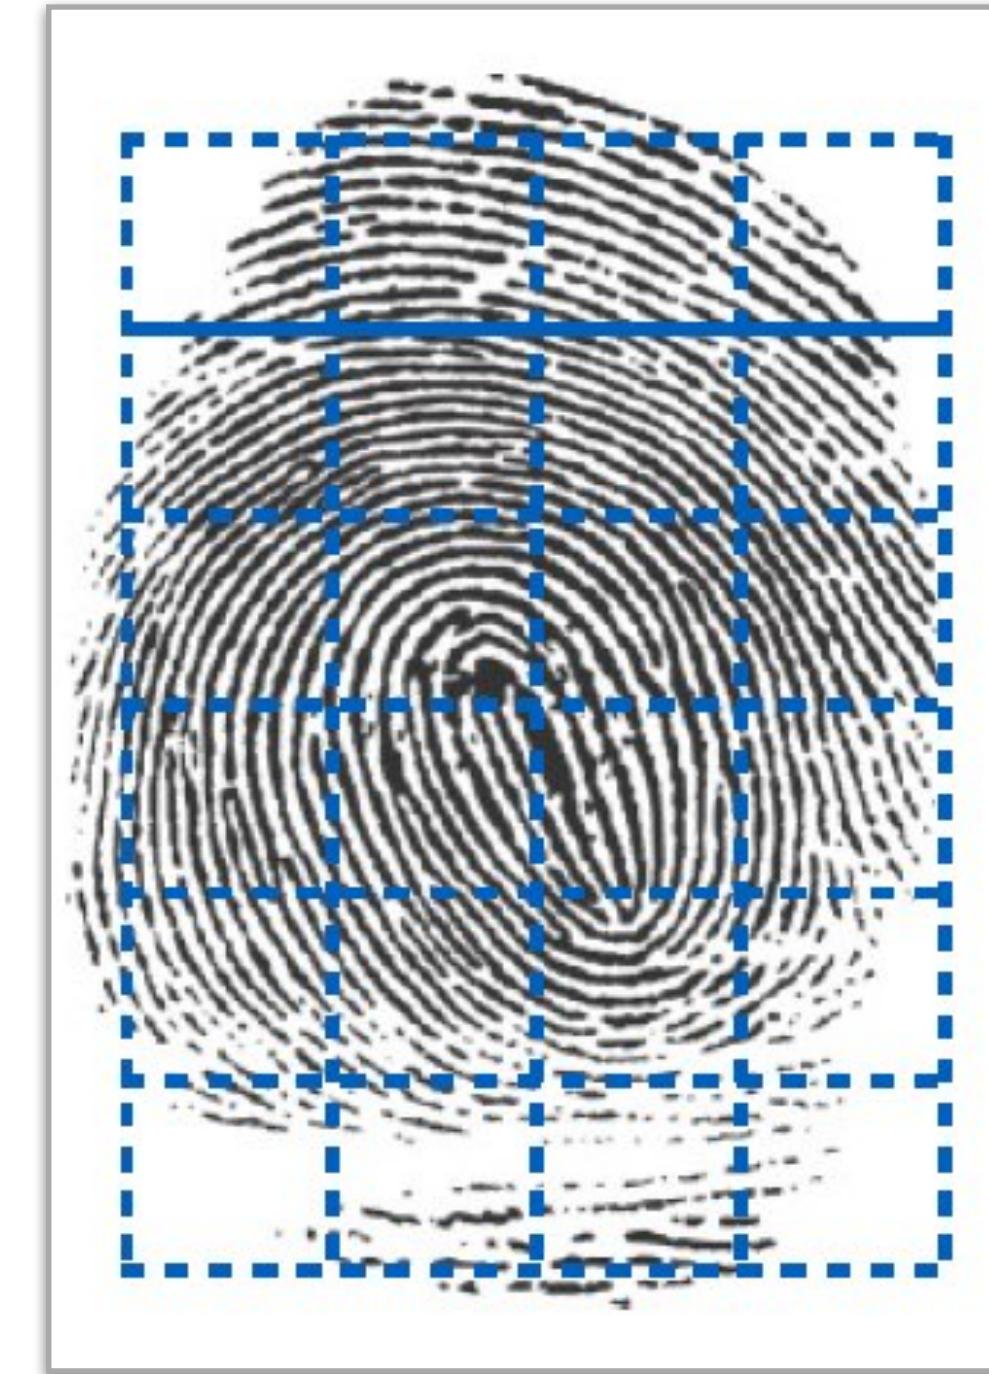

Features

Level-2 Features

Galton's Estimate

A typical fingerprint consists of 24 six-ridge squares.

Hence, chance of correct full fingerprint guess: $1/2^{24}$

Source:
Dr. Walter Scheirer

Features

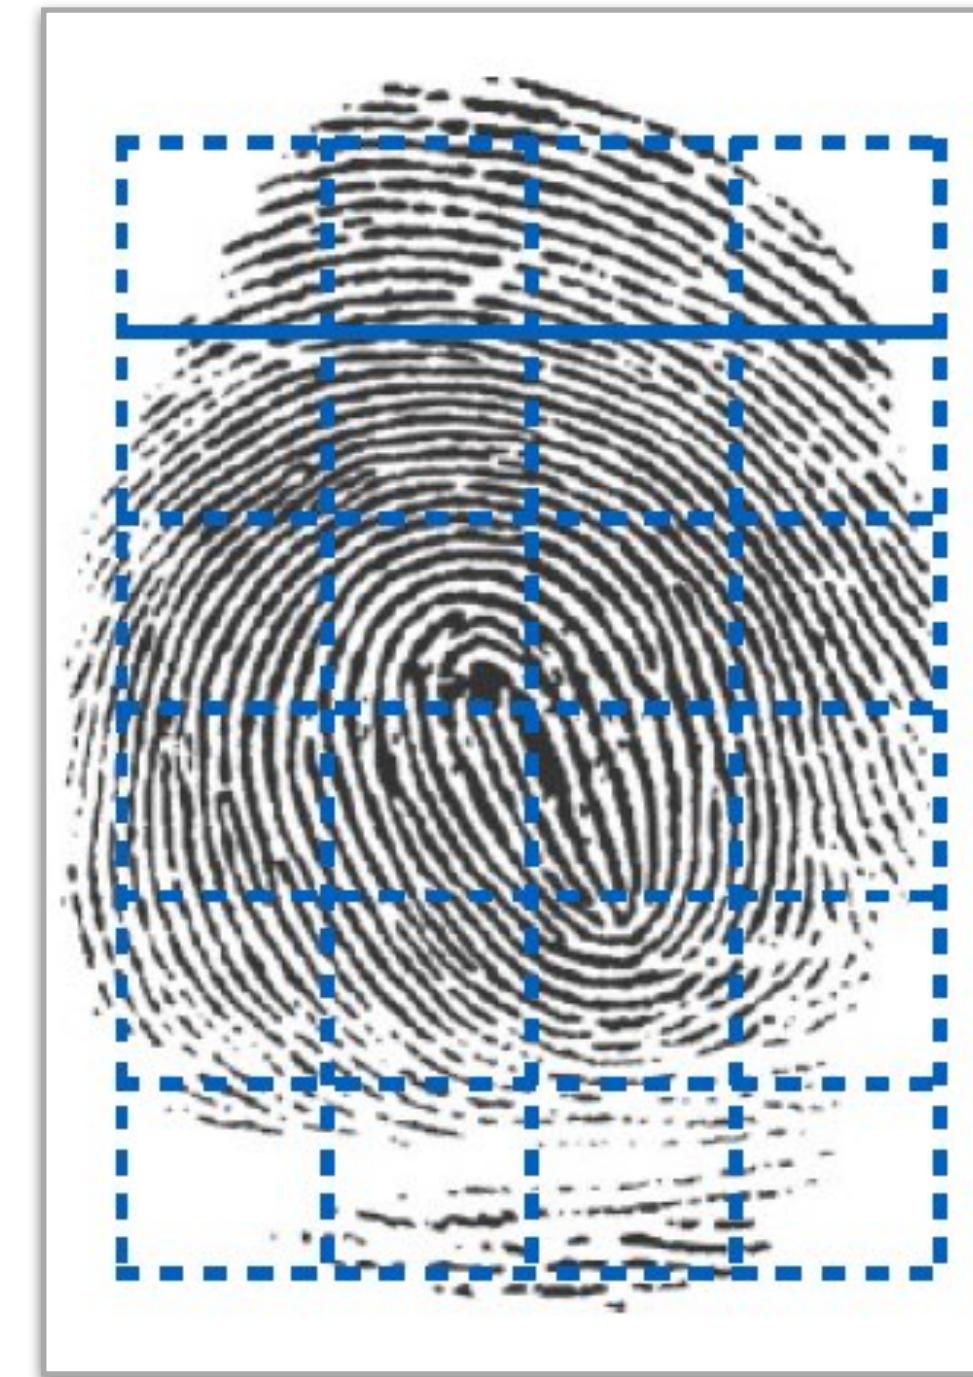

Level-2 Features

Galton's Estimate

For each square:

Chance of correct guess of #ridges
entering and leaving leaving it: $1/2^8$

Chance of correct guess of the
course of ridges within it: $1/2^4$

Source:
Dr. Walter Scheirer

Features

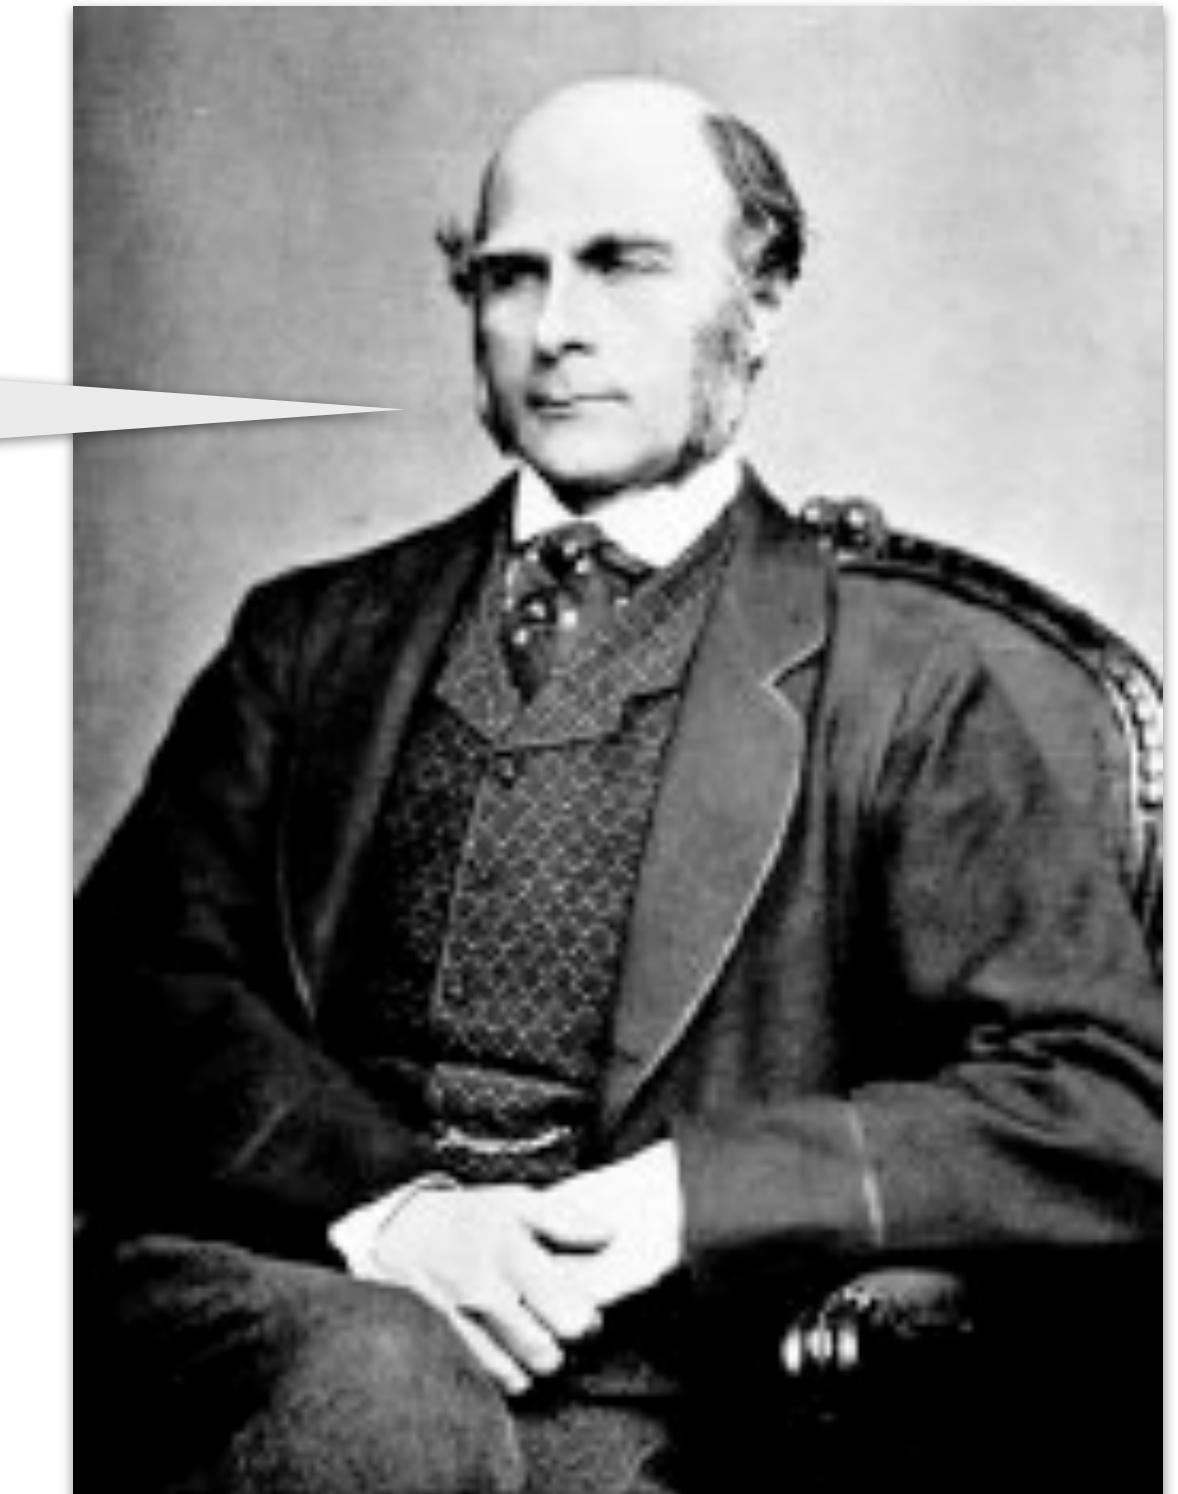

Level-2 Features

Galton's Estimate

Total chance of a random fingerprint
match a particular one:

$$1/2^{24} \times 1/2^8 \times 1/2^4 = 1/2^{36}$$

1 in 64 billion

Features

Level-2 Features

Galton's Estimate

Total chance of a random fingerprint
match a particular one:

$$1/2^{24} \times 1/2^8 \times 1/2^4 = 1/2^{36}$$

How many humans
have ever lived?

107 billion
